## NICKEL ALLOYS FOR SPECIAL APPLICATIONS

Vicensa plant, Italy

Valbruna, founded in 1925 and leader in the production of Stainless Steels, Nickel Alloys and Titanium long products, is underpinned by long experience and a highly qualified customer service. Since the seventies, Valbruna has concentrated part of its production on Super-Austenitic Stainless Steels and Nickel Alloys. Today a wide range of Nickel Alloys is produced in billets, bars, wire rod and wire, making Valbruna an ideal partner for all those manufacturing companies involved in oil, chemical, petrochemical, marine, automotive, energy and power generation sectors.

Bolzano plant, Italy

Fort Wayne plant, IN-USA

### VALBRUNA... SUCH A GREAT REALITY!

Our extensive and strategic distribution network is our corner stone in a global market, granting a worldwide commercial presence with the opportunity for continuous feedback from our customers.

## Nickel Alloys for Special Applications

The development of new technologies and industries often demands materials with enhanced performance and resistance to aggressive environments. These demands have driven the development of highly alloyed iron, nickel and cobalt based.

By varying the combination of different chemical elements a wide range of useful properties can be achieved.

These include exceptional mechanical properties, high creep and rupture strength, enhanced toughness, better metallurgical stability, improved fatigue and thermal shock properties, superior corrosion resistance across a broad spectrum of temperatures while maintaining good fabricability.

Nickel alloys can be easily cold worked to enhance mechanical properties.

Heat treatments can also raise mechanical properties in some nickel alloys and can be used to improve corrosion resistance.

Typical heat treatment of these alloys are:

- Solution treating
- Annealing
- Stress Relieving
- Age Hardening

The heat treatment (temperature, soaking and cooling practice) depends on chemistry, profiles & dimensions, manufacturing process, and final application.

## Classification

Nickel Alloys could be classified according to their chemistry or properties:

### CHEMICAL CLASSIFICATION:

- Ni Alloys
- Ni-Cu Alloys
- Ni-Si Alloys
- Ni-Cr-Alloys
- Ni-Cr-Mo Alloys
- Ni-Cr-Fe-Mo-Cu Alloys
- Cu-Ni Alloys

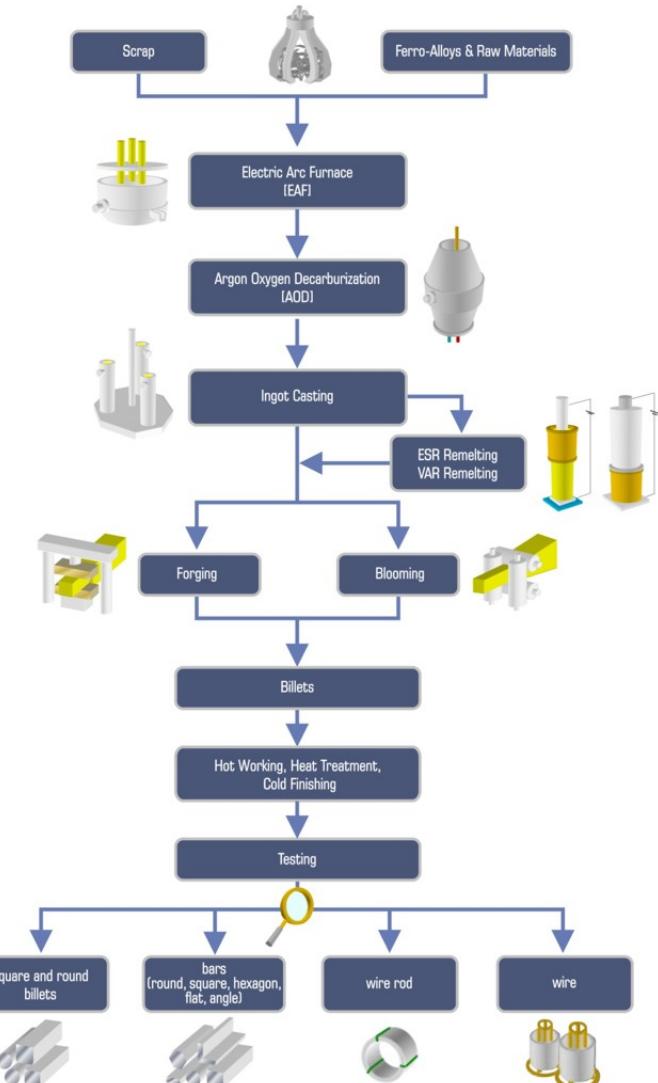

### PROPERTIES CLASSIFICATION:

- Corrosion Resistance
- Heat Resistance

Based on aforesaid assumptions, special alloys could be used for:

- Thermal Processing
- Automotive Industry
- Chemical/Petrochemical Industry
- Power Generation
- Marine Engineering
- Oil & Gas Extraction
- Aerospace Engineering
- Pollution Control & Waste Processing
- Electrical Resistance
- Welding
- Electronic

## NICKEL ALLOYS PRODUCTION FLOW CHART

## OUR NICKEL ALLOYS

VALBRUNA GRADE	COMMERCIAL NAME	UNS	W.N.	BS	INTERNATIONAL DESIGNATION	DESCRIPTION	MELTING PRACTICES		
							ADD	ESR	VAR
AN1	Alloy 800 Alloy 800H Alloy 800HT	N08800 N08810 N08811	1.4876	NA15 NA15(H)	X10NiCrAlTi32-21; X10NiCrAlTi32-20	<b>Alloy 800</b> is an austenitic Fe-Ni-Cr alloy with controlled Al, Ti, Si and Mn additions. It is characterized by high strength for service temperatures up to 540° C, very good resistance to oxidation and to carburization up to 1093° C and corrosion resistance in many corrosive and aqueous media. <b>Alloy 800H</b> is a high Carbon version of alloy 800 which guarantees higher creep and rupture resistance for temperature above 600° C. These properties are also due a higher heat treatment temperature than alloy 800's one that provides an average grain size 5 or coarser. Alloy 800H is preferred for prolonged exposure at high temperatures. <b>Alloy 800HT</b> is a modified chemistry of alloy 800H which guarantees a higher creep and stress rupture for service temperatures above 700° C because of controlled C, Al and Ti additions (C=0.06-0.10%, Al+Ti=0.85-1.20%) and a higher solution annealing temperature grain size 5 or coarser is requested. 800HT is used specially at temperature above 800° C.	✓		
AN2	Alloy 825 Alloy 65	N08825 N08065	2.4858	NA16 NA41	NiCr21Mo NiFe30Cr21Mo3	<b>Alloy 825</b> is a Ti-stabilized fully austenitic Ni-Fe-Cr alloy with Mo and Cu additions. It is characterized by excellent resistance to stress-corrosion cracking, good resistance to pitting, crevice corrosion and to oxidizing and reducing acids. Its mechanical properties are good from cryogenic to moderately high temperature, but at temperature above 540° C this alloy shows a lower ductility and impact strength. It is not recommended for high-temp. services where creep-rupture resistance is requested.	✓		
AN3	Alloy DS	-	1.4862	NA17	X8NiCrSi38-18	<b>Alloy DS</b> is a Ni-Fe-Cr alloy. It is considered a variation of alloy 330 with improved carburization resistance. This grade is characterised by good mechanical properties at high temperature and good resistance to oxidation (up to 1000° C) and to carburization. Its chemical analysis hinders sigma-phase precipitation in the 600-900° C range. Alloy DS is also used for heating elements in industrial furnace up to 1150°C.	✓		
AN3CB	Alloy 330Cb	-	-	-	-	<b>Alloy 330Cb</b> is an austenitic Fe-Ni-Cr alloy with controlled Nb (alias Cb) additions. The presence of Nb greatly increases the creep rupture resistance at high temperature. This alloy exhibits a resistance to carburization thanks to the poor tendency to form Cr-carbides.	✓		
AN3US	Alloy 330	N08330	-	-	-	<b>Alloy 330</b> is a Fe-Ni-Cr alloy with Si and Mn additions. This alloy is characterised by good corrosion resistance to oxidation (up to 1000° C), to carburization, to nitridation and by good mechanical properties at high temperature. It is not recommended for application where high creep-rupture strength is requested.	✓		
AN4	Alloy 904L	N08904	1.4539	904S14	X1NiCrMoCu25-20-5	<b>Alloy 904L</b> is a superaustentic Stainless Steel with high Mo, Cu additions and extremely low carbon content. This alloy provides high resistance to pitting, crevice corrosion, stress-corrosion cracking and inter-crystalline corrosion, excellent resistance to moderately reducing acids such as sulphuric and phosphoric acids, as well as to many chloride-containing media. It has vastly superior properties to those of conventional acid-resistant SS.	✓		
AN5	Alloy 660 Alloy A286	S66286	1.4980	286S31	XGNiCrTiMoVB25-15-2	<b>Alloy 660/A286</b> is a precipitation hardenable superalloy. It is a Fe-Ni-Cr alloy with additions of Mo and Ti. In aged condition this alloy shows high mechanical properties and good creep-rupture, corrosion resistance to oxidation at temperatures up to 700° C. In accordance to different solution treat. temperatures and the quenching, Alloy 660/A286 could be classified in different types or classes provided by the specifications; for instance: solution treatment at 980° C gives the highest creep-rupture strength in precipitation-hardened material, solution treatment at 900° C instead results in improvement ductility and room-temperature tensile strength.	✓	✓	
AV20	Alloy 20	N08020	2.4660	-	NiCr20CuMo	<b>Alloy 20</b> is a low carbon, Nb stabilized austenitic Ni-Fe-Cr alloy with addition of Cu and Mo. It is characterized by an excellent resistance to acid and other aggressive media, to pitting, to crevice corrosion, to intergranular corrosion and to stress corrosion.	✓		
AVC26	Alloy C276	N10276	2.4819	-	NiMo16Cr15W	<b>Alloy C276</b> is a Ni-Cr-Mo alloy with low Carbon, W and Si. This alloy is characterized by high corrosion resistance in a wide range of media, by resistance to pitting, crevice corrosion and stress corrosion cracking.	✓	✓	
AV718CRV AV718HTV	Alloy 718	N07718	2.4668	NA51	NiCr19Fe19Nb5Mo3; NiCr19NbMo	<b>Alloy 718</b> is a precipitation-hardening austenitic Ni-base superalloy. High strength and corrosion resistance (at high and low temperature) are its stand out features. It is also characterized by good oxidation resistance up to 1000° C, good mechanical properties at temperature below 0° C and good resistance to stress-corrosion cracking and pitting.	✓		✓
AV925	Alloy 925	N09925	-	-	-	<b>Alloy 925</b> is an age-hardenable Ni-Fe-Cr alloy with Mo, Cu, Ti and Al additions, characterized by high strength (up to 540° C) and corrosion resistance to pitting, crevice corrosion and stress-corrosion-cracking.	✓	✓	
EG1	Alloy 400	N04400	(2.4360)	NA13	NiCu30Fe	<b>Alloy 400</b> is a Ni-Cu alloy characterized by corrosion resistance in marine and chemical applications (hydrofluoric acid, non-oxidizing dilute acids, alkalis and salt solutions, organic acids, dry gases such as chlorine and to hydrogen chloride), high strength and toughness from temperatures below 0° up to 550° C. The mechanical properties can be improved only by cold working.	✓		
EG2	Alloy K-500	N05500	(2.4375)	NA18	NiCu30AI	<b>Alloy K-500</b> is a precipitation hardening alloy with Al and Ti additions. This alloy is characterised by the same excellent corrosion resistance as alloy 400 but with higher mechanical properties that are maintained for a wide range of temperature (from -200° C up to 650° C). It has a greater tendency toward stress-corrosion cracking in some environments than alloy 400 and in the aged condition it has low magnetic permeability to temperature below to -120° C.	✓		

VALBRUNA GRADE	COMMERCIAL NAME	UNS	W.N.	BS	INTERNATIONAL DESIGNATION	DESCRIPTION	MELTING PRACTICES		
							ADD	ESR	VAR
EG3	Alloy 60	N04060	2.4377	NA33	SG-NiCu 30 MnTi UP-NiCu 30 MnTi	<b>Alloy 60</b> is used for MIG and TIG techniques. It is used for welding alloys such as 400 and K-500. Its properties - as welded - are similar to base alloy. Nevertheless this alloy is not precipitation hardenable.	✓		
EG4	Alloy 401	N04401	2.0842	-	-	<b>Alloy 401</b> is a Cu-Ni alloy. It is used for electrical and electronic applications and for welding.	✓		
GL1	Alloy 600	N06600	2.4816	NA14	NiCr15Fe	<b>Alloy 600</b> is a Ni-Cr-Fe alloy with excellent corrosion resistance to oxidation up to 980° C, to carburization and to stress corrosion cracking at elevated temperatures. It also provides corrosion resistance by many organic and inorganic compounds. This alloy is characterized also by good mechanical properties from temperature below zero up to 700° C, high creep-rupture properties and by good workability. This set of properties suggests the use of alloy 600 for services from cryogenic to high temperatures (above to 1090° C).	✓		
GL2	Alloy 80A	N07080	2.4952	NA20	NiCr20TiAl	<b>Alloy 80A</b> is a Ni-Cr precipitation hardenable alloy. It is characterized by good mechanical properties and resistance to creep at high temperature. Alloy 80A exhibits also good corrosion and oxidation resistance and high fatigue resistance in several conditions. This alloy is used for services up to 815° C.	✓	✓	
GL3	Alloy 625	N06625	2.4856	NA21	NiCr22Mo9Nb	<b>Alloy 625</b> is a low-carbon Ni-Cr-Mo alloy with Nb addition. This alloy is characterized by good mechanical properties (due to effect of Mo and Nb in the matrix structure), excellent resistance to pitting and crevice corrosion, high resistance to stress-corrosion. Also it resists in a wide range of organic and mineral acids and at high temperature as well to oxidation and to carburization. In accordance to heat treat. temperatures it is classified as grade 1 (annealed) or grade 2 (solution ann.). Grade 2 is recommended for applications where good resistance to creep or rupture up to 1000° C is requested. Grade 1 is recommended for applications up to 840° C when finer grain size and high mechanical properties are requested.	✓	✓	✓
GL3/EL	Alloy 625	N06625	2.4831	NA43	SG-NiCr21Mo9Nb UP-NiCr21Mo9Nb	<b>Alloy 625</b> for welding is a Ni-Cr-Mo alloy with low C & Fe contents. It is used for welding alloy 625 components or other grades such as alloy 825, 926 and 20.	✓		
GL4	Alloy 82	N06082	2.4806	NA35	SG-NiCr20Nb UP-NiCr20Nb	<b>Alloy 82</b> is a Ni-Cr-Fe filler metal used for MIG, TIG. It is used for welding alloys such as 600, 601, 800/H/HT, and 330. It exhibits high strength and good corrosion resistance also at high temperature.	✓		
GL5	Alloy 601	N06601	2.4851	NA49	NiCr23Fe	<b>Alloy 601</b> is a Ni-Cr-Fe alloy with high resistance to corrosion and to high temperature oxidation. Generally it is used for thermal and chemical processing, pollution control, aerospace and power generation.	✓		
SG1	Alloy 200 Alloy 201	N02200 N02201	2.4068	NA11 NA12	LC-Ni99.0	<b>Alloy 200</b> is basically a commercially-pure Ni grade that shows excellent corrosion resistance to many corrosive media (especially to caustic alkalies, halides and a large number of organic compounds). It also provides a good combination of mechanical, magnetic properties and low electrical resistivity. <b>Alloy 201</b> is a low carbon version (C max 0.02%) preferred for applications at temperatures above 315° C in order to avoid graphite precipitation.	✓		
SG2	Alloy 55	W82002	(2.4560)	NA47	S-NiFe 40	<b>Alloy 55</b> is used for welding cast-irons to various materials (mild steels, stainless steels, wrought alloys or high-Ni alloys). Weld deposits are machinable.	✓		
SG3	Alloy 55 Ti	-	-	-	-	<b>Alloy 55 Ti</b> is a variation of alloy 55 with addition of Ti.	✓		
SG4	Alloy 212	N02212	2.4110	-	NiMn 2	<b>Alloy 212</b> is a very high-Ni alloy with addition of Mn. It is used for electrical and electronic applications	✓		
SG5	Alloy 36	K93601	1.3912	-	Ni36	<b>Alloy 36</b> is a binary Ni-Fe alloy. Due to its low coefficient of expansion it maintains a constant dimension for a wide range of temperature (from -250° C to 200° C). It also exhibits good mechanical properties at temperature below 0° C. At temperature above 260° C it is non-magnetic. This alloy is ductile and it shows enough corrosion resistance in dry air.	✓		
SG6	Alloy 61	N02061	2.4155	NA32	SG-NiTi 4	<b>Alloy 61</b> is a high-Ni filler metal used for MIG, TIG or PAW welding. It is used for welding of alloys such as 200 & 201 to themselves or to stainless steels, as well as 600, 400, and Cu-Ni alloys.	✓		
VAL40	Alloy 40	-	1.4860	-	NiCr 30 20 (X16NiCr30-20)	<b>Alloy 40</b> is a Ni-Cr alloy with high resistivity and good oxidation resistance. It is used at temperature up to 1100° C.	✓		
VAL60	Alloy 60/40	N06004	2.4867	-	NiCr8015	<b>Alloy 60/40</b> is a Ni-Cr electrical resistance alloy. It is used in service up to 1100° C.	✓		
VAL80	Alloy 80/20	N06003	2.4869	-	NiCr80-20	<b>Alloy 80/20</b> is a Ni-Cr resistance alloy. It is used for service up to 1200° C because of its properties of resistance to oxidation and thermal fatigue.	✓		
VAL4529	Alloy 926	N08926	1.4529	-	X1NiCrMoCuN25-20-7	<b>Alloy 926</b> is a superaustentic stainless steel with increased Mo and N contents compared to 904L. This alloy exhibits exceptional resistance to pitting, crevice corrosion and to stress-corrosion cracking in aggressive media.	✓		
	Alloy 367	N08367	-	-	-	<b>Alloy 367</b> is a corrosion resistant iron-base austenitic stainless steel. It is chemically balanced in order to provide thermal stability and resistance to stress corrosion cracking.	✓		

## CORROSION RESISTANT ALLOYS

In several environments (wide spectrum of acids, alkalis and salts) where the corrosion resistance is the most important criteria for material selection that has to be considered, the choice of the nickel alloys is recommended. These alloys exhibit also good mechanical properties. The corrosion resistance is proved in terms of limited metal loss and in the ability to better withstand localized attack, notably pitting/crevice corrosion, intergranular attack and stress corrosion cracking.

Low Temperature (from room temp. up to 50°C)

LEGEND	VALBRUNA GRADE
Ni Alloys	SG1
Ni-Cu Alloys	EG1; EG2
Ni-Fe-Cr Alloys	AV20; AN5; AV925; AV718CRV; AN2; AN4; VAL4529
Ni-Cr-Mo Alloys	AVC276; GL3

There are some applications at elevated temperatures (such as aircraft components, chemical plant and petrochemical equipment) where a good combination of high strength and corrosion resistance is requested.

For these kinds of applications Nickel alloys could provide the most suitable compromise between different properties such as:

Good resistance to corrosion, creep, fatigue, thermal fatigue, thermal shock, impact, cavitation and erosion, good fracture properties, forming characteristics and weldability.

## HIGH TEMPERATURE ALLOYS - Service temperature

VALBRUNA GRADE	Service temperature		Description
	Min	Max	
<b>AN1 (800)</b>	cryogenic	600° C	good corrosion, heat resistance and mechanical properties
<b>AN1 (800H)</b>	600° C	816° C	good creep-rupture properties at T > 700° C
<b>AN1 (800HT)</b>	700°	1000° C	excellent creep strength (but reduced ductility) at T > 700° C
<b>AN3</b>	-	1000° C	good oxidation resistance
<b>AN3US</b>	-	1150° C	good oxidation resistance also at reducing atmospheres
<b>AN3CB</b>	-	1150° C	better creep rupture resistance
<b>GL1</b>	cryogenic	1093° C	high resistance to oxidation atmospheres
<b>GL2</b>	-	815° C	good mechanical properties and outstanding resistance to creep
<b>GL5</b>	540°	1150° C	good corrosion resistance

## WELDING ALLOYS

Alloys with special chemical balance for welding

**ACCIAIERIE VALBRUNA**

High quality is our standard

## ELECTRICAL RESISTANCE AND ELECTRONIC INSTRUMENT ALLOYS

These alloys are mostly used for the manufacture of heating elements for industrial furnaces and domestic devices.

Alloys with special physical properties, such as a low coefficient of expansion, are requested for applications that include precision components in magnetic shields, integrated circuits, and glass-to-metal seals.
